Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 03/27/2025 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 1 mile of the target property.

Summary Details:

Conditions at listing December 1982): The McColl Site is an inactive waste disposal facility covering 8 acres in Fullerton, Orange County, California. underlies a part of the Los Coyotes Country Club Golf Course. About 200,000 cubic yards of wastes, primarily oil refinery acid sludge and oil field drilling muds, are on-site. The sludge was placed in sumps and covered with drilling muds and other fill materials. The major portion of wastes is acidic and contains sulfur and hydrocarbons. The wastes have reacted to produce a mixture of complex organic and sulfur-containing compounds, some of which are gases. The odors from some of the gases are easily detected by nearby residents. There is a potential for direct contact with the wastes and for contamination of surface water and ground water. In October 1981, EPA, the State, and potentially responsible parties agreed on a three-phase cleanup plan: Phase I, a complete site investigation; Phase II, a development and evaluation of remedial alternatives; and Phase III, cleanup of the site. Phases I and II have been completed, and excavation of the site has been determined to be the most cost-effective remedy. Status July 1983): Phase III is scheduled to begin in October 1983. The State and EPA are entering into negotiations with potentially responsible parties to compel them to pay for or participate in the remedial action. If negotiations are not successful or timely, the State plans to apply for Federal funding and enter into a Cooperative Agreement with EPA.

Comments: The O & M phase began in November 1997 with completion of construction of the RCRA equivalent cap and slurry wall containment system and infiltration controls that comprised the CERCLA remedy. An O and M agreement between U.S. EPA and the oil companies who were identified as Responsible Parties for the McColl site was developed at this time. It has been updated periodically as conditions at the site have changed, requiring fine tuning of the O & M regime.

Background Info:	(RCRA) - equivalent cap and slurry wall containment system as a contingency remedy in the case that solidification of the wastes in place was not found to be feasible. In September 1995, U.S. EPA made the determination that solidification was not technically feasible and made the decision to move forward with the contingency remedy. U.S. EPA subsequently issued the Record of Decision (ROD) for the Source Operable Unit (Source OU) specifying implementation of the RCRA equivalent cap and slurry wall containment system in June 1993. During this period, U.S. EPA identified several major oil oil companies (Shell Oil, Union Oil (UNOCAL), Texaco Inc., Atlantic Richfield Company (ARCO) and Phillips Petroleum as Potentially Responsible Parties (PRPs) for the McColl Site. These oil companies subsequently formed a consortium known as the McColl Site Group (MSG) for the purposes of investigation and remediating the site. The property owner, McAuley LCX Corporation, was also named as a PRP for the McColl Site.

From September 1993 through April 1996, the McColl Site conducted a further remedial investigation at the site in preparation for construction of the cap and slurry wall containment system. Field activities related to the construction of the remedial measures outlined in the Source OU and Groundwater OU RODs were initiated in June 1996. Onsite construction of the remedy began on March 31, 1977 and was completed in November 1997. The former sump area has been incorporated into the Los Coyotes golf course, a land use that is highly beneficial to the community.

Under CERCLA, U.S. EPA is required to perform a Five-Year Review at each superfund site to determine whether or not the remedy continues to be adequately protective of human health and the environment. U.S. EPA issued the first five-year Review Report for the McColl site on September 30, 2002. The Five-Year Report identified several issues relation to operation and maintenance (O & M) which will be reviewed by a committee of stakeholders and implemented prior to the next five-year review. In the mean time, U.S. EPA has initiated measures to de-list the McColl Site from the National Priority List (NPL).

The 22-acre McColl Hazardous Waste Site was an inactive waste disposal facility located in the northwest section of the City of Fullerton, Orange County, California.

Housing developments border the site to the northeast, east, and to the south. The Los Coyotes golf course is located to the south of the former McColl Site and there is a regional park on the west border of the site. An operating oil field occupies the open area north of the site.

From 1942 through 1946 approximately 72,600 cubic yards of petroleum waste sludge was deposited in twelve sump waste sumps. These sumps were grouped into two areas of the site, identified as the Ramparts area and the Los Coyotes area. During the late 1950's and early 1960's, three sumps in the Ramparts area were covered with bentonite based drilling muds in an attempt to control odors coming from the site. In the late 1950's six of the sumps at the lower end of the property were covered with natural fill materials resulting from construction of the Los Coyotes golf course adjacent to the McColl site. Use of the site as an active disposal area concluded in 1964.

The waste materials at the McColl Site became a source of malodorous air emissions of sulfur dioxide (SO₂), tetrahydrothiophenes (THTs), benzene, and other hydrocarbons. Inorganic contaminants such as arsenic, lead, nickel, aluminum, beryllium, cadmium, manganese, thallium, selenium, and chromium were found in the groundwater at concentrations near the Maximum Contaminant Levels (MCLs). Organic compounds such as benzene, 1,2-dichloroethane, methylene

chloride, and bis (2-ethylhexyl) phthalate were also found in the groundwater.

The history of investigation at the site began in 1980 when DTSC and U.S. EPA began a joint investigation of the site. In 1982 the McColl Site was placed on the federal National Priority List (NPL), which made the cleanup activities eligible for funding under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). During the period from 1984 through 1996, several cleanup plans were proposed for the site. The original cleanup proposal articulated in 1984 was excavation and offsite disposal of the wastes under the jurisdiction of DTSC. However, a court injunction blocked DTSC from implementing this remedy. In 1989 U.S. EPA resumed the role of lead agency. In 1992, U.S. EPA updated the feasibility study and proposed solidification of the wastes in place as the preferred remedial alternative. The 1992 plan also identified installation of a Resource, Recovery and Conservation Act

Environmental Interest/Information System:

All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database. The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste. California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

Environmental Interest/Information System:

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that

Environmental Interest/Information System:

The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS), EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), and Toxic Release Inventory (TRI).

All generators and treatment, storage, and disposal (TSD) facilities who handle hazardous waste are required to report to the EPA Administrator at least once every two years. The data collected is used to create the National Biennial Resource Conservation and Recovery Act (RCRA) Hazardous Waste Report. This data is processed within the RCRA Information (RCRAInfo) database.

The California Environmental Reporting System (CERS) is a statewide web-based user and information exchange system to support over 140,000 regulated businesses and over 130 local agencies in electronically collecting and reporting significant hazardous materials, hazardous waste and compliance and enforcement data as mandated by California law. Under oversight by Cal/EPA, certified local governing agencies (Unified Program Agencies - UPAs) consolidate, coordinate and provide consistent regulatory activities for six state and federal environmental programs.

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS), EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), and Toxic Release Inventory (TRI).

Violation Notes: prevention equipment inspection for 36 months.
Returned to compliance on 01/03/2022. OBSERVATION: Facility currently utilizes ATG for overfill prevention. USTs with multiple ATGs that only can activate external alarms when the first UST overfill condition occurs do not meet overfill requirements. CORRECTIVE ACTION: Plan check SR0148468 received by this Agency. Ensure each UST has a functional overfill prevention independent of the other USTs at the facility (i.e., installing a separate alarm unit or other appropriate OPE equipment for each tank).

Violation Description: Failure to comply with one or more of the following overfill prevention equipment requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. Install/retrofit overfill prevention equipment that does not use flow restrictors on vent piping to meet overfill prevention equipment requirements when the overfill prevention equipment is installed, repaired, or replaced on and after October 1, 2018. For USTs installed before October 1, 2018, perform an inspection by October 13, 2018 and every 36 months thereafter. For USTs installed on and after October 1, 2018, perform an inspection at installation and every 36 months thereafter. Inspected within 30 days after a repair to the overfill prevention equipment. Inspected using an applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer. Inspected by a certified UST service technician. Maintain records of overfill prevention equipment inspection for 36 months.

Violation Notes: Returned to compliance on 01/03/2022. OBSERVATION: Facility currently utilizes ATG for overfill prevention. USTs with multiple ATGs that only can activate external alarms when the first UST overfill condition occurs do not meet overfill requirements. CORRECTIVE ACTION: Plan check SR0148468 received by this Agency. Ensure each UST has a functional overfill prevention independent of the other USTs at the facility (i.e., installing a separate alarm unit or other appropriate OPE equipment for each tank).

for orange grove cultivation. The facility manufactured radar systems and associated components. Site operations were categorized into manufacturing/fabrication, assembly, laboratory, testing, warehouse, facility operations and maintenance, transportation and offices. A Part B permit was issued in 1985 by the Department of Health Services, (DTSC's predecessor). DTSC approved the renewed Part B application in 1991. All hazardous Waste Management Units were certified closed on June 30, 1993. Raytheon purchased the assets and liabilities of Hughes Aircraft Company on December 17, 1997. In December 1998, Raytheon sold 293 acres of the site. The current owners have conducted demolition activities to prepare the site for development. Currently the site is approximately 95% developed. Raytheon is liable for the Corrective Action. On January 15, 2003, Raytheon signed a Corrective Action Consent Agreement with DTSC

chemical substances and/or mixtures. Certain substances are generally excluded from TSCA, including, among others, food, drugs, cosmetics and pesticides. TSCA addresses the production, importation, use, and disposal of specific chemicals including polychlorinated biphenyls (PCBs), asbestos, radon and lead-based paint.

The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

California's Hazardous Waste Tracking System Data Mart (HWTS-DATAMART) provides information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 12-27-2012
Violations Found: Yes
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: Weather: clear and cool. SWPPP last review date is April 2007; missing site plan. Reviewed SPCC site plan and found this inadequate. Most production and shipping areas are plumbed to drain to a main sump which pumps runoff and wastewater to a large oil skimmer vault before discharge to sewer. The site plan does not reflect the differences in drainage to storm drain systems versus sewer. Site plan does not show all areas of industrial activity particularly at the main building. Site walk found an undocumented discharge from the lab compressor set-up; contacts are not certain of the nature of the discharge. Numerous instances of chronic spills and leaks of food oil in production areas but containment system was generally found intact except for an apparent leak through a dike at the truck unloading area. Following observations apply to areas that drain to storm drain systems: Apparent leak from a corrosive tank observed by the shipping well; tank is to contain emergency blowdown of ammonia/water coolant. Oily dirt found on compactor roll-off at packaging department. Pit area by packaging department and a work station NE of the tank farm are oily from spills occurring during maintenance.

Eval General Type: Compliance Evaluation Inspection
Eval Date: 04-02-2001
Violations Found: No
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: The SWPPP looked acceptable. A review of the 99/00 AR indicated high O&G, Zn and Cu. Leakage of oil was found around the air compressor. Rusted equipment and piping material were found outside the machine shop. The plastic container near the oil silos used as secondary containment was about two-thirds full. A large amount of chemical containers were stored on site. Oil leakage was found throughout the facility. Ms. Granada stated that all the leaks were collected in trenches that would be pumped to an oil separator basin. During the

rain, a level controller would be used to pump the rainwater from the basin to the storm drain. The interior of the basin was coated with brown and black oil. Staff suggested that a sample of the runoff be taken and analyzed to make sure that the discharge meet the benchmark values. Near the end of the inspection, staff was approached by Mr. Larry Rocque, Technical Services Manager. He advised that an approval from the company headquarters back East would be needed before pictures could be taken in the facility. Staff responded that pictures were taken only for storm water related issue, and that no pictures of process or production equipment were taken. Staff agreed that no more pictures would be taken.

THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES

The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.

Site History: Former Keyes Fibre was a manufacturer of Styrofoam food containers. PCE and TCE were used for the manufacturing process. Soil contamination in the areas north and south of the parking lot were detected. Several environmental investigations were conducted for the upper saturated zone (aka A-Zone) which occurs in laterally discontinuous sand up to 25 feet deep. Various technologies used for treatment of soil and groundwater at the A-Zone. Another contaminant, 1,4-Dioxane, was discovered with concentrations up to 400 g/L in the A-Zone. The consultant provided the rationale that because of very low hydraulic conductivity at that zone and a very good sealing provided by the A/B aquitard, 1,4-Dioxane mass will not be harmful to any nearby groundwater resources with a beneficial use. A site closure for the A-Zone was granted in July 2004. During investigations for the A-Zone, it was discovered that the lower saturated zone (aka B-Zone) has also been contaminated with PCE and TCE. The B-zone occurs in interbedded silts and clays with relatively continuous sand to a depth of 55 feet. Geomatrix conducted pilot testing for an in-situ bioremediation approach for the Site. Corn syrup was used to enhance the microbial activities at the subsurface. Two injection wells BIO-2 and BIO-3 were used for this purpose. Some decrease of PCE and TCE concentrations was observed in the two wells. However, the breakdown product was only 1,2-DCE. No vinyl chloride or ethene was detected which suggests that biodegradation was not completed as expected. Groundwater flow direction for the B-zone is toward west/northwest. Additional investigation was conducted in September and October 2009. High concentrations of PCE and TCE were found in the source area. They were also detected in the downgradient area of the Site. Additional investigation in the downgradient areas and a focused FS was conducted in 2010. The lateral delineation of the implicated groundwater was completed. The FS proposed in-situ bioremediation as the most viable alternative for the groundwater cleanup. An extensive treatability study in the form of in-well

The California Environmental Protection Agency (CalEPA) has recently implemented a new data warehouse system (nSite). This data warehouse combines and merges facility and site information from five different systems managed within CalEPA. The five systems are: California Environmental Reporting System (CERS), EnviroStor, GeoTracker, California Integrated Water Quality System (CIWQS), and Toxic Release Inventory (TRI).

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. Site History:

In 1986, an underground clarifier was removed from the above-referenced site. Subsequent investigations indicated that the underlying soil and groundwater were impacted from discharges of volatile organic compounds. Beginning in 1991, a groundwater cleanup system was operating at the site to remediate groundwater affected by releases of trichloroethylene (TCE) from an underground clarifier. SVE operations at the Site included a former pilot-scale SVE system (former pilot-scale system) and a former full-scale SVE system (former full-scale system) near what is currently 2307 Moore Avenue. The former pilot-scale system operated from October 1991 to August 1992. The former full-scale system operated from January 1993 to

November 1996. Vapor phase granular activated carbon was used to remove volatile organic compounds (VOCs) from the soil vapor extracted by both the former pilot-scale and former full-scale systems before discharging the treated vapor into the atmosphere. Approximately 7,500 pounds (lbs) of trichloroethylene (TCE), the primary VOC at the Site, was recovered by the former pilot-scale system. Approximately 3,500 lbs of TCE was recovered by the former full-scale system. The Regional Water Quality Control Board (RWQCB), Santa Ana Region, approved closure of the former full-scale system in February 1998. The closure was considered appropriate based on results of rebound testing conducted in January 1998 that indicated reduced concentrations of TCE in extracted soil vapor. The current groundwater treatment system consists of an advanced oxidation process (AOP) for treatment of 1,4-dioxane and volatile organic compounds followed by liquid phase granular activated carbon (LGAC). The AOP system began operation at the Site in February 2015. As of March 31, 2020, the cumulative volume of TCE removed from groundwater by the remediation system since system startup was approximately 117 gallons. The cumulative volume of groundwater treated by the remediation system is approximately 1,731 million gallons.

CA BOND EXP. PLAN:

Reponsible Party: NPL SITE CLEANUP WORKPLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: This site has been included on the National Priority List (NPL). Therefore, to the extent that federal funds are available, the Department will seek federal funds to cover the RI/FS study, remedial action, operation and maintenance and final cleanup. To the extent that federal funds are available, federal funding for remedial action, operation and maintenance as well as the final remedy will be at the 90 percent level. The State must pay a 10 percent share toward the federal funds awarded for those activities. A portion of the Bond fund will be used to meet the State's share. Some of the Bond fund will support certain State-only expenditures. Those State-only expenditures are used to support necessary ground water investigation, operation and maintenance. community relations and removal/remedial action activities, which EPA will not fund, and to support important site activities until federal funding is provided through the State's cooperative agreement with EPA. DHS is utilizing HSA and Bond funds for the EIR since EPA would not authorize federal funds for this activity. In addition, Bond funds will be utilized for the preparation of the RAP since EPA will not fund this State activity. The current estimates for Phase I remediation at the McColl Site range from \$25 million to \$110 million. DHS will be responsible for 10 percent of the Phase I cleanup remedy. For purposes of this Expenditure Plan, DHS has estimated \$110 million for the Phase I cleanup cost. Phase II cleanup costs cannot be estimated until the ground water RI/FS is completed. To ensure timely implementation of the ground water RI/FS, DHS is projecting a State share for this activity. DHS and EPA will pursue cost recovery of all expenditures from any identified responsible parties.
Site Description: The McColl site is an inactive waste disposal facility located in the northwestern portion of the City of Fullerton. From 1942 to 1946, acid sludge,

Hazardous Waste Desc: a refinery waste resulting from production of aviation fuel, was disposed in a series of twelve waste pits at the site. In the early to mid-1950s, drilling mud from nearby oil fields was used to cover the six eastern pits. In the late 1950s, the six remaining sumps were covered by the construction of the Los Coyotes Golf Course. Approximately 97,100 cubic yards to 265,000 cubic yards of waste and contaminated soil are onsite.

Threat To Public Health & Env: Acidic petroleum sludge is the predominant waste at this site. The waste is characterized by a low pH sulfur content and high concentrations of aromatic and aliphatic hydrocarbons. When disturbed, the waste produces air emissions of sulfur dioxide and volatile hydrocarbons, which include benzene. In addition, the waste contains tetrahydrothiophene, an odor-producing compound.

Site Activity Status: Ground water contamination from the site has been detected in the shallow and deep aquifers, however, nearby public water supply wells are not contaminated. Also, under disturbed site conditions, there is also a risk from air emissions containing the above noted contaminants. Currently, all wastes are covered with soil, therefore there are no adverse air emissions coming from the site. The site is also completely fenced and guarded to prevent unauthorized access and direct contact with waste materials.

A two-phase remediation process is being taken at the McColl site. The first phase will address cleanup of the contaminated soils and waste at the site. The second phase will address ground water contamination at the site. DHS is preparing an environmental impact report (EIR) for the site as required by the Kern County Superior Court Injunction (May, 1985) and a RAP. EPA has conducted additional investigative work (soil contamination study, waste characterization and ground water study). EPA is also preparing the supplemental re-evaluation of alternatives (SROA) which evaluates three categories of remedial alternatives. The RAP, SROA and proposed plan documents will be released for public comment in late Winter, 1988. These documents will set forth the DHS/EPA proposed remedy for the contaminated soils and waste materials at the site. Because ground water contamination has recently been confirmed, DHS will undertake a full-scale ground water remedial investigation and feasibility study (RI/FS) in early 1989. A separate remedial action will be performed by DHS/EPA to address contaminated ground water.
